

When your IDE first starts, right click the Default Package within the project and src folder. Navigate to Build Path and then click Configure Build Path.

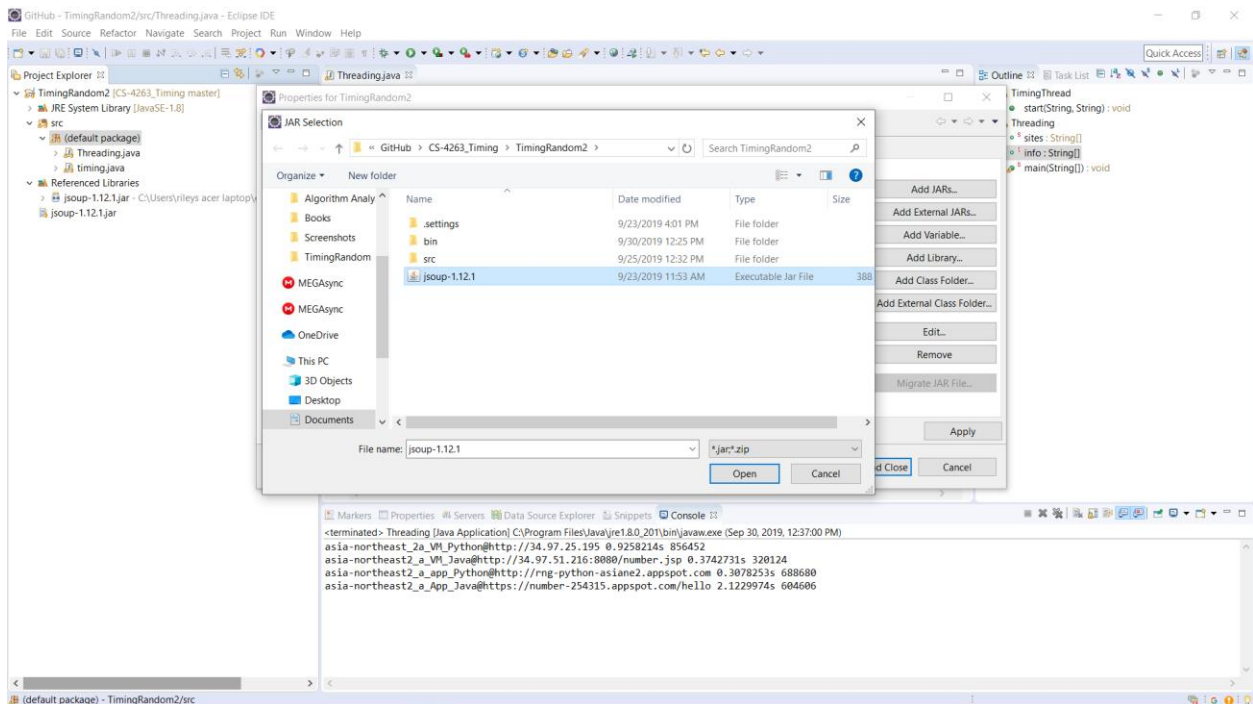

When the new window opens, click on the tab marked Libraries.

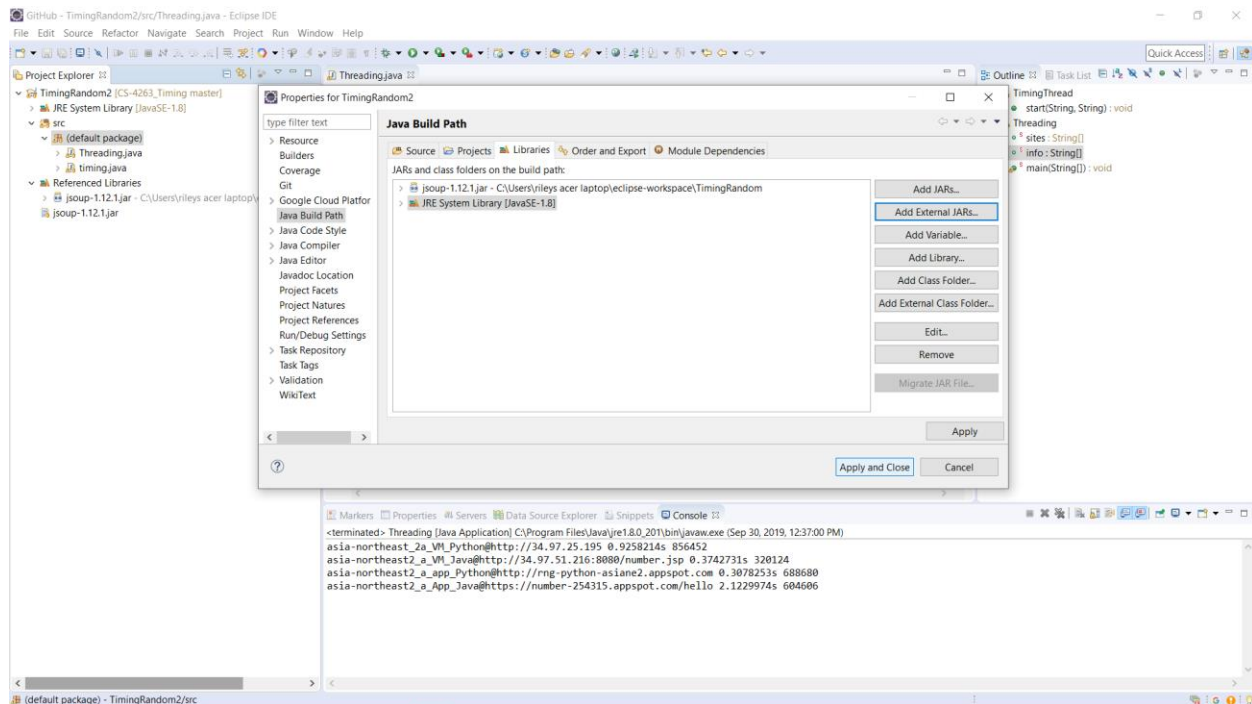

Then click Add External JARs.

When the file explorer opens click on jsoup-1.12.1. This file should be in the main project folder.

Once it is added to the list of libraries, then click Apply and Close. This should resolve any errors with the program.

You can then change the IP Addresses and Site info by modifying the strings within the data arrays of “sites” and “info”

Example output:
